Storage Management – Directory Structure

Dr. Rahul NagpalComputer Science

Example of Index and Relative Files

Directory Structure

A collection of nodes containing information

about all files **Directory Files** F 4 F 2 F 3 Fn

Both the directory structure and the files reside on disk

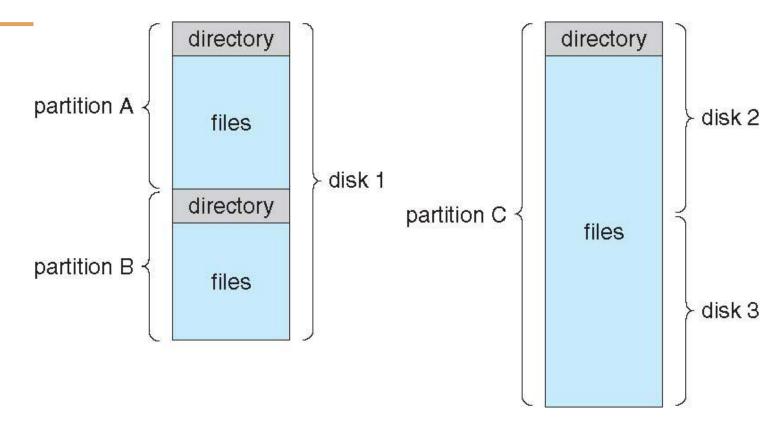

Disk Structure

- Disk can be subdivided into partitions
- Disks or partitions can be RAID protected against failure
- Disk or partition can be used raw without a file system, or formatted with a file system
- Partitions also known as minidisks, slices
- Entity containing file system known as a volume
- Each volume containing file system also tracks that file system's info in device directory or volume table of contents
- As well as general-purpose file systems there are many special-purpose file systems, frequently all within the same operating system or computer

A Typical File-system Organization

Types of File Systems

- We mostly talk of general-purpose file systems
- But systems frequently have may file systems, some general- and some special- purpose
- Consider Solaris has
 - tmpfs memory-based volatile FS for fast, temporary I/O
 - objfs interface into kernel memory to get kernel symbols for debugging
 - ctfs contract file system for managing daemons
 - lofs loopback file system allows one FS to be accessed in place of another
 - procfs kernel interface to process structures
 - ufs, zfs general purpose file systems

Operations Performed on Directory

- Search for a file
- Create a file
- Delete a file
- List a directory
- Rename a file
- Traverse the file system

Directory Organization

The directory is organized logically to obtain

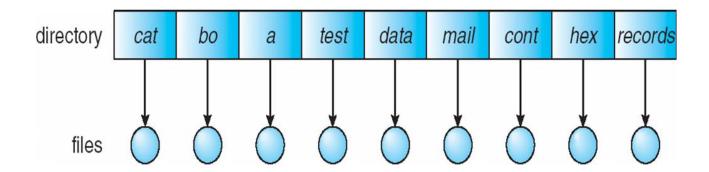

- Efficiency locating a file quickly
- Naming convenient to users
 - Two users can have same name for different files
 - The same file can have several different names
- Grouping logical grouping of files by properties, (e.g., all Java programs, all games, ...)

Single-Level Directory

A single directory for all users

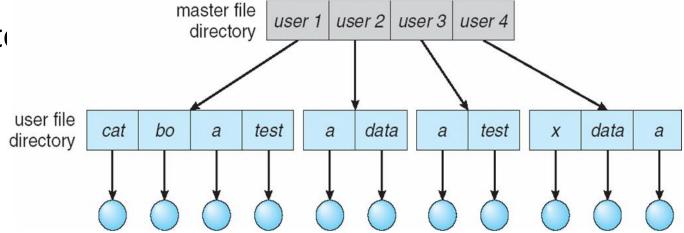

- Naming problem
- Grouping problem

Two-Level Directory

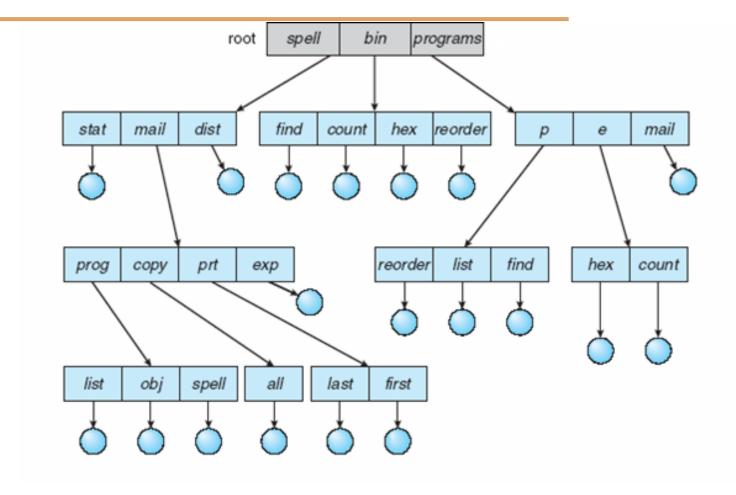

• Separate director

- Path name
- Can have the same file name for different user
- Efficient searching
- No grouping capability

Tree-Structured Directories

Tree-Structured Directories (Cont.)

- Efficient searching
- Grouping Capability
- Current directory (working directory)
 - cd /spell/mail/prog
 - type list

Tree-Structured Directories (Cont)

- Absolute or relative path name
- Creating a new file is done in current directory
- Delete a file

• Creating a new subdirectory is done in current directory

mkdir <dir prog copy prt exp count

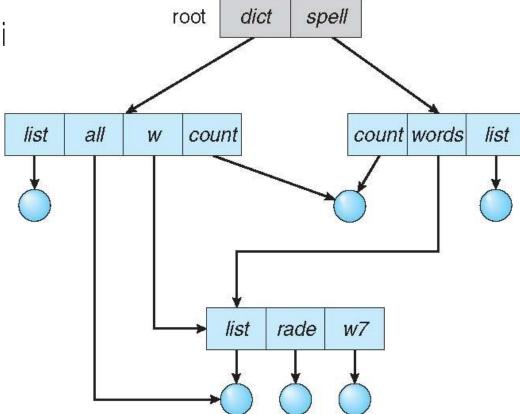

Example: if in current directory /mail

Defeting the entire subtree rooted by "mail"

Acyclic-Graph Directories

Have shared subdi

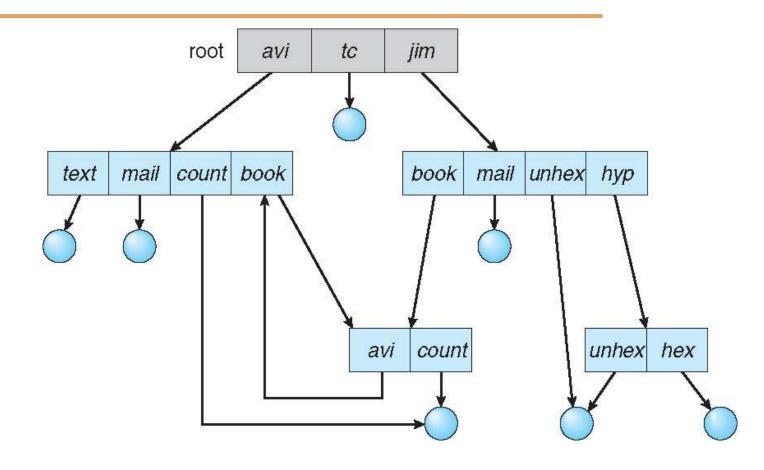

Acyclic-Graph Directories (Cont.)

- Two different names (aliasing)
- If *dict* deletes *list* ⇒ dangling pointer
 Solutions:
 - Backpointers, so we can delete all pointers
 Variable size records a problem
 - Backpointers using a daisy chain organization
 - Entry-hold-count solution
- New directory entry type
 - Link another name (pointer) to an existing file
 - Resolve the link follow pointer to locate the file

General Graph Directory

General Graph Directory (Cont.)

- How do we guarantee no cycles?
 - Allow only links to file not subdirectories
 - Garbage collection
 - Every time a new link is added use a cycle detection algorithm to determine whether it is OK
