DATA ANALYTICS

Unit 3: Ljung Box and Theil's coefficient

Jyothi R.
Department of Computer Science and
Engineering

INTRODUCTION

- Contents

- Ljung-Box for Auto-Correlations

- Power of forecasting model: Theil's Coefficient

Ljung-Box Test for Auto-Correlations

- Ljung−Box is a test of lack of fit of the forecasting model and checks whether the auto-correlations for the errors are different from zero.

- The null and alternative hypotheses are given by

- H_0: The model does not show lack of fit

- H_0: The model exhibits lack of fit

Ljung-Box Test for Auto-Correlations

- The Ljung−Box statistic (Q-Statistic) is given by (Ljung and Box, 1978)

$$Q(m) = n(n+2) \sum_{k=1}^{m} \frac{\rho_k^2}{n-k}$$

- where n is the number of observations in the time series,

- k is the number of lag,

- ρ_k is the auto-correlation of lag k, and

- m is the total number of lags.

Ljung-Box Test for Auto-Correlations

- Q-statistic is an approximate chi-square distribution with $m - p - q$ degrees of freedom where p and q are the AR and MA lags.

- The Q-statistic for ARIMA(1, 1, 1) is 10.216 (Table 1) and the corresponding p-value is 0.855 and thus we fail to reject the null hypothesis.

- Table 1: ARIMA (1, 1, 1) model summary for Omelette demand

Model	Model Fit Statistics			Ljung–Box Q(18)		
	R-Squared	RMSE	MAPE	Statistics	Df	Sig.
Omellette-Model_1	0.584	3.439	20.830	10.216	16	0.855

- $Q(m)$ measures accumulated auto-correlation up to lag m.

POWER OF FORECASTING MODEL: THEIL'S COEFFICIENT

- The power of forecasting model is a comparison between

- Naive forecasting model and the model developed.

- In the Naive forecasting model, the forecasted value for the next period is same as the last period's actual value

- $F_{t+1} = Y_t.$

- Theil's coefficient (U-statistic) is given by (Theil, 1965)

DATA ANALYTICS

POWER OF FORECASTING MODEL: THEIL'S COEFFICIENT

- For the data shown in Table 213.14 (demand for avionic system spares),
- The *U*-statistic calculations are shown in Table 3.
- TABLE 3:U-statistic calculation

Day	Y_t	ARMA (1,2) Forecast	$(Y_t - F_t)^2$	Naïve Forecast ($F_{t+1} = Y_t$)	$(Y_t - F_t)^2$
31	503	464.8107	1458.423	443	3600
32	688	378.5341	95769.15	503	34225
33	602	444.6372	24763.04	688	7396
34	629	685.8851	3235.909	602	729
35	823	743.5124	6318.281	629	37636
36	671	630.7183	1622.614	823	23104
37	487	649.3491	26357.22	671	33856
		Total	159524.6	Total	140546

POWER OF FORECASTING MODEL: THEIL'S COEFFICIENT

- Theil's coefficient (*U*-statistic) is given by (Theil, 1965)

$$U = \frac{\sum\limits_{t=1}^{n}(Y_{t+1} - F_{t+1})^2}{\sum\limits_{t=1}^{n}(Y_{t+1} - Y_t)^2}$$

- Theil's coefficient is the ratio of the mean squared error of the forecasting model to the MSE of the Naïve model.

- The value of $U < 1$ indicates that forecasting model is better than the Naive forecasting model.

- $U > 1$ indicates that the forecasting model is not better than Naive model.

POWER OF FORECASTING MODEL: THEIL'S COEFFICIENT

Table 2: Monthly demand (quantity of 200 gram packets) along with

Period	Month	Demand in Units	Average Price	Period	Demand in Units	Average Price
1	January	10500472	37	25	10658309	36
2	February	10123572	34	26	8677622	38
